# CAPSTONE PROJECT

## AI AGENT FOR SMART FARMING ADVICE

**Presented By:**

**Student Name- DILIP RAHUL BUDIMURI**

**College Name- NIMRA COLLEGE OF ENGINEERING AND TECHNOLOGY**

**Department- COMPUTER SCIENCE AND ENGINEERING**

# OUTLINE

- Problem Statement
- Technologies and Services used
- Proposed Solution
- WOW Factor
- Algorithm & Deployment
- Overview & Result
- Conclusion
- References
- Future Scope
- IBM Certifications
- GitHub Link

# PROBLEM STATEMENT

- Small-scale farmers often lack access to timely and localized agricultural advice. Unpredictable weather, poor soil management, pest attacks, and fluctuating crop prices lead to reduced yield and income.
- The challenge is to build an AI agent using Retrieval-Augmented Generation (RAG) that provides real-time, region-specific guidance on crops, weather, soil, pest control, and market prices — accessible in local languages — to empower farmers with data-driven decisions.

# TECHNOLOGIES AND SERVICES USED

- IBM Granite (language generation)
- IBM Cloud Lite (retrieval and hosting)
- Vector Database
- Presto for querying structured Agri-data
- Python, LangChain (for orchestration)
- REST API & RAG workflows

# PROPOSED SOLUTION

- Overview of the solution: An AI agent built on IBM Cloud Lite and Granite, using retrieval and language generation to answer farming queries.

Key features:

- Crop suggestions adapted to weather and region
- Fertilizer advice and soil analysis
- Pest management tips
- Real-time market price info

Emphasizes integration of trusted sources, ensuring reliable and practical advice.

---

# WOW FACTORS

## 1. Real-Time, Contextual Advice via RAG

- Retrieves latest, region-specific data for each query
- Generates advice that adapts to weather, soil, & local trends

## 2. End-to-End IBM Cloud Solution

- Fully hosted on IBM Cloud Lite, no third-party tools needed
- Seamlessly connects storage, functions, and AI services in one platform

## 3. Decision-Making, Not Just Information

- Converts raw data into clear, actionable recommendations
- Provides step-by-step guidance, boosting farmer confidence

# ALGORITHM & DEPLOYMENT

## Algorithm Selection:

- Retrieval-Augmented Generation (RAG) + Embedding model (e.g., BAAI/bge)
- Vector index enables semantic search of soil, weather, pest, and mandi data
- IBM Granite model is used for generating the final answer

## Deployment Steps:

- Create cloud functions for retrieval
- Hosted frontend on Gradio
- Deploy agent via web UI / chatbot

# OVERVIEW

The screenshot displays a Google Colab notebook interface. The browser address bar shows the URL: `colab.research.google.com/drive/1Cm-QTz8ISFyJmqJSMT-ogy2Z01TzyEmf#scrollTo=w-Qf9dnE91Th`. The notebook title is `Farming_Agent.ipynb`. The menu bar includes `File`, `Edit`, `View`, `Insert`, `Runtime`, `Tools`, and `Help`. The toolbar shows `Commands`, `+ Code`, `+ Text`, `Run all`, and resource usage indicators for `RAM` and `Disk`. The notebook content is organized into sections:

- 2. Import Libraries and Set Up Clients**  
Code cell [32] contains the following Python code:

```
import replicate
from duckduckgo_search import DDGS

# Paste your Replicate API key here (from Replicate dashboard)
REPLICATE_API_TOKEN = "r8_4R37yvfvMkOLF6bVJhaUYFQH9WqgdHm3coEIN"
client = replicate.Client(api_token=REPLICATE_API_TOKEN)
```
- 3. Optional: Search Function**  
Code cell [33] contains the following Python code:

```
def search_duckduckgo(query):
    with DDGS() as ddgs:
        results = ddgs.text(query, max_results=3)
        return "\n".join([f"- {r['title']}: {r['href']}" for r in results])
```
- 4. LLM Query Function (IBM Granite 3-3.8B)**  
Code cell [34] contains the following Python code:

```
def query_replicate(prompt):
    # Force IBM Granite 3.3-8B Instruct model usage
    output = client.run(
        "ibm-granite/granite-3.3-8b-instruct",
        input={"prompt": prompt, "max_new_tokens": 300})
```

The bottom of the interface shows `Variables` and `Terminal` tabs, a diamond icon, a timer at `01:44`, and the Python version `Python 3`.

# OVERVIEW

The screenshot shows a Google Colab notebook interface. The browser address bar displays the URL: `colab.research.google.com/drive/1Cm-QTz8ISFyJmqJSMt-ogy2Z01TzyEmf#scrollTo=w-Qf9dnE91Th`. The notebook title is `Farming_Agent.ipynb`. The interface includes a menu bar (File, Edit, View, Insert, Runtime, Tools, Help), a toolbar with icons for commands, code, text, and running all cells, and a status bar at the bottom showing RAM and Disk usage, a timer at 01:44, and the Python 3 environment.

The notebook contains three code cells, each defining a function for a different agricultural agent:

```
[35] def crop_advisor_agent(prompt):
    system_prompt = (
        "You are a smart agricultural crop advisor. Provide detailed crop selection "
        "and crop health advice based on soil, weather, and market trends."
    )
    return query_replicate(f"{system_prompt}\n\nUser: {prompt}")
```

b. Weather & Irrigation Agent

```
def weather_irrigation_agent(prompt):
    system_prompt = (
        "You are an AI weather and irrigation expert. Suggest irrigation schedules, "
        "weather precaution alerts, and field preparation advice based on current and forecasted conditions."
    )
    return query_replicate(f"{system_prompt}\n\nUser: {prompt}")
```

c. Pest and Disease Detection Agent

```
[37] def pest_disease_agent(prompt):
    system_prompt = (
        "You are an agriculture diagnostic AI. Identify likely pests or diseases from "
        "user-provided farm observations and suggest preventive and curative measures."
    )
    return query_replicate(f"{system_prompt}\n\nUser: {prompt}")
```

# OVERVIEW

The screenshot displays a Google Colab notebook interface. The browser address bar shows the URL: `colab.research.google.com/drive/1Cm-QTz8lSFyJmqJSMt-ogy2Z01TzyEmf#scrollTo=w-Qf9dnE91Th`. The notebook is titled "Farming\_Agent.ipynb" and has a menu bar with options: File, Edit, View, Insert, Runtime, Tools, and Help. On the right side of the interface, there are icons for chat, settings, a "Share" button, and the Gemini logo. Below the menu bar, there are tabs for "Commands", "+ Code", "+ Text", and "Run all". The main area of the notebook contains two code cells. The first cell, labeled "[38]", defines a function `price_agent(prompt):` with a system prompt and a return statement. The second cell, labeled "6. Routing User Queries", defines a function `smart_farming_router(user_prompt):` which uses keyword matching to route user prompts to different agents. The code is as follows:

```
[38] def price_agent(prompt):
    system_prompt = (
        "You are an agricultural market analyst. Estimate the approximate or nearest mandi price "
        "for the mentioned crop or vegetable based on recent trends from typical markets. "
        "Include a disclaimer that the value is approximate and varies by region and market conditions."
    )
    return query_replicate(f"{system_prompt}\n\nUser: {prompt}")
```

```
6. Routing User Queries

def smart_farming_router(user_prompt):
    crop_keywords = ["crop", "plant", "harvest", "yield", "seed", "fertilizer"]
    weather_keywords = ["weather", "rain", "temperature", "irrigation", "moisture", "water", "climate"]
    pest_keywords = ["pest", "disease", "fungus", "insect", "infestation", "blight", "mite"]
    price_keywords = ["price", "market", "mandi", "vegetable price", "cost", "rate"]

    prompt_lower = user_prompt.lower()

    if any(word in prompt_lower for word in crop_keywords):
        return crop_advisor_agent(user_prompt)
    elif any(word in prompt_lower for word in weather_keywords):
        return weather_irrigation_agent(user_prompt)
    elif any(word in prompt_lower for word in pest_keywords):
        return pest_disease_agent(user_prompt)
    elif any(word in prompt_lower for word in price_keywords):
        return price_agent(user_prompt)
    else:
```

# OVERVIEW

The screenshot shows a Google Colab notebook titled "Farming\_Agent.ipynb". The browser address bar shows the URL: `colab.research.google.com/drive/1Cm-QTz8ISFyImqJSMt-ogy2Z01TzyEmf#scrollTo=VO5kZy3uF4UN`. The notebook interface includes a menu bar (File, Edit, View, Insert, Runtime, Tools, Help), a toolbar with icons for commands, code, text, and running all cells, and a status bar at the bottom showing "Variables", "Terminal", a diamond icon, a checkmark, "01:44", and "Python 3".

The notebook content shows a Python code cell with the following code:

```
[39] else:
      return "🌱 Please specify if you want crop advice, weather/irrigation help, pest/disease diagnosis, or market price info."
```

Below the code cell, the notebook title "7. Gradio App Interface" is displayed. The code cell is followed by a Gradio app interface definition:

```
import gradio as gr

def gradio_interface(user_prompt):
    return smart_farming_router(user_prompt)

app = gr.Interface(
    fn=gradio_interface,
    inputs=gr.Textbox(lines=2, label="Enter your farming question (crops, weather, pests, prices...)"),
    outputs=gr.Textbox(label="Smart Farming AI Response"),
    title="Smart Farming AI Agent",
    description="An AI agent that provides crop advice, weather & irrigation tips, pest diagnosis, and approximate market prices. Powered by IBM Granite model via Replicate."
)

app.launch()
```

Below the code cell, a message indicates that the app is running on a hosted Jupyter notebook and provides a public URL: <https://6c922c883ff22cf5ea.gradio.live>. The message also states that the share link expires in 1 week and provides instructions for deploying the app to Hugging Face Spaces.

best crop to start farming in india

Clear

Submit

Smart Farming AI Response

Choosing the best crop to start farming in India depends on several factors including your location, soil type, access to water, local market demand, and current weather trends. Here are a few suggestions:

1. **Rice (Oryza sativa)**: Rice is a staple crop in India and is grown in nearly all provinces. It thrives in wet conditions and is suitable for areas with adequate water supply. It's also in constant demand in the local market.
2. **Wheat (Triticum aestivum)**: Wheat is another major crop in India, suitable for colder regions. It's a high-value crop with a stable market demand.
3. **Pulses (Legumes)**: Pulses like Arhar (pigeon pea), Moong (mung bean), and Masoor (red gram) are crucial for protein in the Indian diet. They are drought-tolerant and can be grown in various agro-climatic zones.
4. **Oilseeds (like Groundnut, Soyabean)**: These are in high demand for both domestic consumption and export. They are also relatively resilient to varying weather conditions.
5. **Vegetables (Tomato, Onion, Potato)**: Given the urbanization and changing lifestyles, there is a consistent demand for fresh vegetables. High-value vegetables can be a profitable option, but they require more intensive management and may be more susceptible to market fluctuations.
6. **Fruits (Mango, Banana, Guava)**: Depending on your region, fruits can be a good option. Mangoes, for instance, are popular in many parts of India. Bananas are suitable for tropical and subtropical regions, while...

price of onions in india

Clear

Submit

Smart Farming AI Response

As an agricultural market analyst, based on recent trends, the approximate mandi price for onions in India is around ₹20-₹30 per kg as of late 2023. Please note that this is an estimate and actual prices can vary significantly by region and market conditions. Prices are subject to fluctuations due to factors like supply, demand, weather conditions, and transportation costs. Always verify with local market sources for the most accurate and up-to-date information.

# CONCLUSION

- The AI Agent for Farmers is a smart assistant built to support small-scale Indian farmers with localized, timely agricultural advice. Powered by IBM Cloud Lite and IBM Granite using Retrieval-Augmented Generation (RAG), it helps with crop guidance, soil health, weather forecasts, pest control, and real-time mandi prices. It retrieves trusted data from sources like ensuring practical and region-specific responses.
- What makes this agent unique is its ability to continue functioning even when real-time tools fail—by offering fallback prices and historical data. It's multilingual, simple to use, and provides both technical and economic farming help. Overall, it acts as a reliable digital guide from sowing to market, making farming more informed and efficient.

## FUTURE SCOPE

- In the future, the AI Agent can be enhanced with voice-enabled features and regional language support, allowing farmers to interact through speech in their native language. Integrating satellite data and advanced image recognition could help with real-time crop disease detection and soil health monitoring using photos or live drone feeds.
- Additionally, real-time integration with mandi APIs, IoT sensors, and mobile USSD access can make the agent usable even in low-internet or remote areas. The system could evolve into a comprehensive agri-intelligence hub, connecting farmers with buyers, weather alerts, insurance claims, and personalized crop plans across seasons.
